

04 - Stakeholder & User Needs Analysis

1. Purpose

This analysis identifies the stakeholders affected by the opportunities progressing from the Problem Analysis stage and defines the user needs that should guide subsequent requirements and solution design.

Two opportunities progress into this analysis:

ID	Opportunity
OP-01 — Compliance Investigation Efficiency	How might we reduce repetitive information-gathering and analysis effort during flagged-transaction investigations while preserving analyst judgement, accuracy and regulatory oversight?
OP-02 — Compliance Case Traceability	How might we maintain consistent traceability of compliance-case evidence, reasoning, decisions and subsequent actions while minimising unnecessary documentation effort for analysts?

OP-01 and OP-02 were progressed with conditions. OP-03 was placed on hold because the underlying unmet user need was not sufficiently established. Pasted text

2. Stakeholder Identification

Stakeholder	Role in Process	OP-01	OP-02
-------------	-----------------	-------	-------

Compliance Analyst	Reviews flagged transactions, gathers and assesses relevant information, determines case outcomes and documents reasoning.	Primary	Primary
Compliance Manager / Reviewer	Reviews escalated cases and relies on sufficient investigation information and decision reasoning.	Secondary	Secondary
Compliance Auditor	Requires traceable case records to review how compliance decisions were reached.	—	Secondary
Regulator / Supervisory Authority	Indirectly relies on appropriate investigation, record-keeping and regulatory reporting processes.	Indirect	Indirect

The Compliance Analyst is the primary stakeholder across both opportunities. The previous analysis identified managers/reviewers as secondary stakeholders for investigation efficiency

and managers, reviewers, assurance functions and supervisory authorities as relevant to traceability. Pasted text Pasted text

3. OP-01 — Compliance Investigation Efficiency

3.1 Primary Stakeholder

Compliance Analyst

Compliance analysts perform human-led investigation activities including reviewing alerts, gathering information, analysing customer activity and documenting case justifications. The magnitude of the resulting workload and scalability impact remains unquantified. Pasted text

3.2 User Need

Review flagged cases and relevant investigation information efficiently in one place while retaining control over the final decision and maintaining investigation quality.

The need consists of three elements:

Need Dimension	Description
Information accessibility	Relevant case information should be available for efficient review.
Investigation efficiency	Avoidable repetitive information-gathering and analysis effort should be reduced where possible.
Human control	Analysts must retain judgement and responsibility for the final compliance decision.

3.3 Desired Outcome

Reduce avoidable investigation effort while maintaining:

- investigation quality;
- analyst judgement;
- accuracy;
- appropriate escalation; and

- regulatory oversight. Pasted text

3.4 Constraints

Constraint	Requirement
Human	Analyst judgement and appropriate human review must be preserved.
Regulatory	Investigation and escalation processes must remain compatible with applicable AML/CFT obligations.
Security	Customer and investigation information must remain confidential.
Business	Existing investigation controls and operational continuity must not be weakened.
Technical	The project should not assume access to TNG Digital production systems.

These constraints were explicitly carried forward from the opportunity analysis. Pasted text

4. OP-02 — Compliance Case Traceability

4.1 Primary Stakeholder

Compliance Analyst

The analyst requires a practical way to record the reasoning and actions associated with a compliance decision without unnecessary documentation effort.

4.2 User Need

Record compliance decisions and associated reasoning without having to manually structure the complete case history.

The intended outcome is not to reduce required evidence. It is to maintain complete and retrievable case histories while avoiding unnecessary documentation burden. Pasted text

4.3 Secondary Stakeholders

Compliance Manager / Reviewer

Compliance Auditor

These stakeholders require sufficient case history to understand and review how a compliance decision was reached.

4.4 User Need

Trace what occurred during a compliance case and understand the evidence, reasoning, decision and subsequent actions associated with it.

The required case history should enable an authorised reviewer to determine:

- what occurred;
- what evidence was considered;
- what decision was made;
- why the decision was made; and
- what action followed.

4.5 Desired Outcome

Maintain a **complete, retrievable and understandable case history** without imposing unnecessary documentation effort. Pasted text

4.6 Constraints

Constraint	Requirement
Attribution	Reasoning must remain attributable to the responsible reviewer or analyst.
Record keeping	Required records must remain complete and retrievable.
Security	Sensitive case information requires appropriate confidentiality and access controls.

Evidence quality	Reduced documentation effort must not result in weaker evidence.
Technical	The project should not assume access to existing TNG Digital production case-management systems.

5. User Needs Summary

ID	Opportunity	Stakeholder	User Need
UN-01	OP-01	Compliance Analyst	Review flagged cases and relevant investigation information efficiently in one place while retaining control over the final decision and maintaining investigation quality.
UN-02	OP-02	Compliance Analyst	Record compliance decisions and associated reasoning without manually structuring the complete case history.

UN-03	OP-02	Compliance Manager / Reviewer / Auditor	Trace the case history and understand the evidence, reasoning, decision and subsequent actions associated with it.
--------------	-------	---	--

6. Assumptions and Validation Gaps

Assumption / Gap	Impact	Further Validation
The activities creating the greatest analyst investigation effort are not known.	UN-01 may target activities that provide limited efficiency improvement.	Analyst interviews / process observation
Investigation workload and turnaround time are not quantified.	The materiality of the efficiency opportunity remains uncertain.	Operational data
Existing TNG Digital case-management capabilities are unknown.	Some elements of UN-02 or UN-03 may already be adequately supported.	Internal system/process review
Analyst documentation burden has not been quantified.	The potential value of reducing documentation effort remains uncertain.	Analyst interview / observation

These remain explicit research gaps from the preceding analysis. Pasted text

7. Analysis Outcome

Three user needs are carried forward:

UN-01 — Efficient Investigation Review

Consolidate and simplify the review of relevant case information while preserving human judgement and investigation quality.

UN-02 — Efficient Decision Recording

Enable analysts to record decisions and reasoning without unnecessary manual structuring.

UN-03 — Case Traceability

Enable authorised reviewers to reconstruct and understand the evidence, reasoning, decision and subsequent actions associated with a compliance case.
