

07 - Process & User Flow Analysis

0. SwimLane Diagram

1. Purpose

This stage defines the end-to-end process for the MVP's post-alert compliance investigation workflow.

The process shows how a pre-flagged case moves between the **Transaction Monitoring System, Compliance Analyst, Compliance Investigation System, and Compliance Manager / Reviewer**, while preserving human decision-making and maintaining a traceable case history.

The swimlane diagram serves as the primary process artefact.

2. Process Scope

Boundary	Definition
Start	A flagged case is assigned by the Transaction Monitoring System.
End — Dismiss	The analyst dismisses the case and the case is closed after the decision and audit information are recorded.

End — Escalate	The analyst escalates the case and it is sent to the Compliance Manager / Reviewer for further review.
-----------------------	--

Out of Process Scope

The process does not include:

- detection of suspicious transactions;
- generation of transaction-monitoring alerts;
- production TNG Digital system integration;
- fully automated compliance decision-making.

The workflow begins only after a case has already been flagged.

3. Actors and Responsibilities

Actor / System	Responsibility
Transaction Monitoring System	Assigns an already-flagged case for investigation.
Compliance Analyst	Reviews the case, determines whether sufficient information is available, evaluates the case, makes the final analyst decision and records the decision rationale.
Compliance Investigation System	Retrieves and presents case information, supports additional information gathering, records decision details and maintains the audit trail.
Compliance Manager / Reviewer	Receives and reviews cases escalated by the Compliance Analyst.

4. Main Process Flow

Step 1 — Case Assignment

The Transaction Monitoring System assigns a flagged case for investigation.

Step 2 — Open Case

The Compliance Analyst opens the assigned case.

Step 3 — Retrieve Case Information

The Compliance Investigation System retrieves the relevant case information.

Step 4 — Present Case Information

The system presents the case summary, supporting evidence and relevant risk indicators to the analyst.

Step 5 — Review Case

The analyst reviews the available case information and determines whether sufficient information is available to make a decision.

Step 6 — Obtain Additional Information

If the available information is insufficient, the analyst requests further information.

The system retrieves or adds the additional information and updates the case. The analyst then reviews the updated case.

This cycle continues until sufficient information is available to proceed.

Step 7 — Evaluate Case Outcome

Once sufficient information is available, the analyst evaluates the case and determines the appropriate outcome.

Step 8 — Record Decision Rationale

The analyst records the reasoning supporting the decision.

Step 9 — Record Case Decision

The system records the relevant decision information, including the decision reasoning, supporting evidence, responsible analyst and timestamp.

Step 10 — Update Audit Trail

The system updates the chronological case history to preserve the investigation and decision record.

Step 11 — Apply Decision Outcome

The workflow branches according to the analyst's decision:

Dismiss

→ The case is closed.

Escalate

→ The case is sent to the Compliance Manager / Reviewer for further review.

5. Decision Points

5.1 Sufficient Information?

Decision: Is sufficient information available to make a case decision?

Outcome	Process
Yes	Proceed to case evaluation.
No	Request further information, update the case and return to case review.

This decision creates an iterative investigation loop where additional information can be obtained before the analyst makes a final decision.

5.2 Decision Outcome

Decision: What action should be taken following the analyst's assessment?

Outcome	Process
Dismiss	Record the decision and close the case.
Escalate	Record the decision and send the case for further review.

The system supports the decision process but does not independently determine the final outcome.

6. Alternate Flow — Additional Information Required

The primary alternate flow occurs when the analyst determines that the available information is insufficient.

Flow:

Review Case

- Information Insufficient
- Request Further Information
- Retrieve / Add Information
- Update Case
- Review Updated Case
- Reassess Information Sufficiency

The case does not proceed to a final analyst decision until sufficient information is available for the analyst to make an assessment.

7. Process Controls

Control	Application
Human Decision Authority	The Compliance Analyst retains responsibility for the final analyst decision.
Decision Rationale	The reasoning supporting the decision is recorded.
Evidence Traceability	Relevant evidence is associated with the case and decision record.
User Attribution	The responsible analyst is associated with the recorded decision.
Timestamping	Relevant decision events are timestamped.
Audit History	Case events and decisions are preserved chronologically.

Escalation Control	Escalated cases are routed to the appropriate reviewer.
Access Control	Case information is restricted to authorised users.
Record Integrity	Historical case information is preserved against untraceable alteration.

8. Requirements Traceability

Process Activity	Related Requirement
Retrieve and display case information	FR-01 — Consolidated case view
Display case summary	FR-02 — Concise case summary
Display risk indicators	FR-03 — Highlight relevant risk indicators
Request further information	FR-04 — Investigation actions
Analyst determines outcome	FR-05 / NFR-02 — Human final decision
Record decision rationale	FR-06 — Capture decision reasoning
Record resulting action	FR-07 — Capture subsequent action
Structure case record	FR-08 / NFR-04 — Consistent record structure
Update chronological history	FR-09 — Chronological case history
Associate reasoning with decision	FR-10 — Decision traceability
Associate action with decision	FR-11 — Action traceability

Reviewer accesses escalated case	FR-12 / NFR-08 — Authorised review
Preserve historical information	NFR-06 / NFR-07 — Auditability and integrity

9. Process Outcome

The defined process establishes an end-to-end post-alert investigation workflow in which the **Compliance Investigation System supports information retrieval, case presentation, investigation activities and traceability**, while the **Compliance Analyst retains responsibility for reviewing the evidence and determining the final analyst decision**.

The workflow produces two primary outcomes:

Dismissed Case — decision and reasoning are recorded, the audit history is updated, and the case is closed.

Escalated Case — decision and reasoning are recorded, the audit history is updated, and the case is routed to the Compliance Manager / Reviewer for further review.
